Abstract

This research project is aimed at computerizing real-time scheduling for users to avoid issues with client timings which could cause delays. Scheduling without anyone having to pick up the phone saves you time and money. The app will be split into two applications which communicate with one another through a secure internet connection. The first is an admin panel, used by the office to manage the users, and the patients. The second is the user panel, used by the carer to use the application.

Project Explanation

Web Portal Functionality:
 Admin Panel/Coordinator panel – This side will be used by both the administrator to approved holidays, add a new patient, manage user profile list. The system also builds a profile of the clients and holds the address and some useful information. This part of the system can also be used to generate reports on staff appointments, delay times and so on to help improve performance within the office.
